4.1.1 Detailed Description

These functions specify the API for Data Compression operations.

Remarks

4.1.2 Macro Definition Documentation

4.1.2.1 #define QATZIP_API_VERSION_NUM_MAJOR (1)

```
QATZIP Major Version Number
```

The QATZIP API major version number. This number will be incremented when significant changes to the API has occurred. The combination of the major and minor number definitions represent the complete version number for this interface.

4.1.2.2 #define QATZIP_API_VERSION_NUM_MINOR (1)

```
QATZIP Minor Version Number
```

The QATZIP API minor version number. This number will be incremented when minor changes to the API has occurred. The combination of the major and minor number definitions represent the complete version number for this interface.

4.1.2.3 #define QZ_OK (0)

```
QATZIP Session Status definitions and function return codes
```

This list identifies valid values for session status and function return codes.Success

4.1.2.4 #define QZ_SKID_PAD_SZ 48

```
Get the max compressed output length
```

Get the max compressed output length.

This function shall not be called in an interrupt context. None None Yes No Yes

Parameters

in	*src_sz*	Input data length in byte sess Session handle (pointer to opaque instance and session data)

Return values

dest_sz	Max compressed data output length in byte. When src_sz is equal to 0, the return value is QZ_COMPRESSED_SZ_OF_EMPTY_FILE(34). When integer overflow happens, the return value is 0

Precondition

None

Postcondition

None

Note

Only a synchronous version of this function is provided.

4.1.3 Typedef Documentation

4.1.3.1 typedef enum PinMem_E PinMem_T

```
Supported memory types
```

This enumerated list identifies memory types supported by QATZip.

4.1.3.2 typedef enum QzCrcType_E QzCrcType_T

```
Supported checksum type
```

This enumerated list identifies the checksum type for input/output data. The format can be CRC32, Adler or none.

4.1.3.3 typedef enum QzDataFormat_E QzDataFormat_T

```
Streaming API input and output format
```

This enumerated list identifies the data format supported by QATZip streaming API. A format can be raw deflate data block, deflate block wrapped by GZip header and footer, or deflate data block wrapped by GZip extension header and footer.

4.1.3.4 typedef enum QzDirection_E QzDirection_T

```
Compress or decompress setting
```

This enumerated list identifies the session directions supported by QATZip. A session can be compress, decompress or both.

4.1.3.5 typedef enum QzHuffmanHdr_E QzHuffmanHdr_T

This API provides access to underlying compression functions in QAT hardware. The API supports an implementation that provides compression service in software if not all of the required resources are available to execute the compression service in hardware.

The API supports threaded applications. Applications can create threads and each of these threads can invoke the API defined herein.

For simplicity, initializations and setup function calls are not required to obtain compression services. If the initialization and setup functions are not called before compression or decompression requests, then they will be called with default arguments from within the compression or decompression functions. This results in several legal calling scenarios, described below.

Scenario 1 - All functions explicitly invoked by caller, with all arguments provided.

qzInit(&sess, sw_backup); qzSetupSession(&sess, &params); qzCompress(&sess, src, &src_len, dest, &dest_len, 1); qzDecompress(&sess, src, &src_len, dest, &dest_len); qzTeardownSession(&sess); qzClose(&sess);

Scenario 2 - Initialization function called, setup function not invoked by caller. This scenario can be used to specify the sw_backup argument to qzInit.

qzInit(&sess, sw_backup); qzCompress(&sess, src, &src_len, dest, &dest_len, 1); calls qzSetupSession(sess, NULL); qzTeardownSession(&sess); qzClose(&sess);

Scenario 3 - Calling application simply invokes the actual qzCompress functions.

qzCompress(&sess, src, &src_len, dest, &dest_len, 0); calls qzInit(sess, 1); calls qzSetupSession(sess, NULL); qzCompress(&sess, src, &src_len, dest, &dest_len, 1);

Notes: Invoking qzSetupSession with NULL for params sets up a session with default session attributed, detailed in the function description below.

If an application terminates with out invoking tear down and close functions, process termination will invoke memory and hardware instance cleanup.

If a thread terminates without invoking tear down and close functions, memory and hardware are not cleaned up until the application exits.

```
Supported Huffman Headers
```

This enumerated list identifies the Huffman header types supported by QATZip.

4.1.3.6 typedef struct QzSession_S QzSession_T

```
QATZIP Session opaque data storage
```

This structure contains a pointer to a structure with session state.

4.1.3.7 typedef struct QzSessionParams_S QzSessionParams_T

```
QATZIP Session Initialization parameters
```

This structure contains data for initializing a session.

4.1.3.8 typedef struct QzStatus_S QzStatus_T

```
QATZIP status structure
```

This structure contains data relating to the status of QAT on the platform.

4.1.3.9 typedef struct QzStream_S QzStream_T

```
QATZIP Stream data storage
```

This structure contains metadata needed for stream operation.

4.1.4 Enumeration Type Documentation

4.1.4.1 enum PinMem_E

```
Supported memory types
```

This enumerated list identifies memory types supported by QATZip.

Enumerator

COMMON_MEM Allocate non-contiguous memory

PINNED_MEM Allocate contiguous memory

4.1.4.2 enum QzCrcType_E

```
Supported checksum type
```

This enumerated list identifies the checksum type for input/output data. The format can be CRC32, Adler or none.

Enumerator

QZ_CRC32 CRC32 checksum

QZ_ADLER Adler checksum

NONE No checksum

4.1.4.3 enum QzDataFormat_E

```
Streaming API input and output format
```

This enumerated list identifies the data format supported by QATZip streaming API. A format can be raw deflate data block, deflate block wrapped by GZip header and footer, or deflate data block wrapped by GZip extension header and footer.

Enumerator

QZ_DEFLATE_RAW Data is in raw deflate format

QZ_DEFLATE_GZIP Data is in deflate wrapped by GZip header and footer

QZ_DEFLATE_GZIP_EXT Data is in deflate wrapped by GZip extension header and footer

QZ_FMT_NUM

4.1.4.4 enum QzDirection_E

```
Compress or decompress setting
```

This enumerated list identifies the session directions supported by QATZip. A session can be compress, decompress or both.

Enumerator

QZ_DIR_COMPRESS Session will be used for compression

QZ_DIR_DECOMPRESS Session will be used for decompression

QZ_DIR_BOTH Session will be used for both compression and decompression

4.1.4.5 enum QzHuffmanHdr_E

This API provides access to underlying compression functions in QAT hardware. The API supports an implementation that provides compression service in software if not all of the required resources are available to execute the compression service in hardware.

The API supports threaded applications. Applications can create threads and each of these threads can invoke the API defined herein.

For simplicity, initializations and setup function calls are not required to obtain compression services. If the initialization and setup functions are not called before compression or decompression requests, then they will be called with default arguments from within the compression or decompression functions. This results in several legal calling scenarios, described below.

Scenario 1 - All functions explicitly invoked by caller, with all arguments provided.

qzInit(&sess, sw_backup); qzSetupSession(&sess, &params); qzCompress(&sess, src, &src_len, dest, &dest_len, 1); qzDecompress(&sess, src, &src_len, dest, &dest_len); qzTeardownSession(&sess); qzClose(&sess);

Scenario 2 - Initialization function called, setup function not invoked by caller. This scenario can be used to specify the sw_backup argument to qzInit.

qzInit(&sess, sw_backup); qzCompress(&sess, src, &src_len, dest, &dest_len, 1); calls qzSetupSession(sess, NULL); qzTeardownSession(&sess); qzClose(&sess);

Scenario 3 - Calling application simply invokes the actual qzCompress functions.

qzCompress(&sess, src, &src_len, dest, &dest_len, 0); calls qzInit(sess, 1); calls qzSetupSession(sess, NULL); qzCompress(&sess, src, &src_len, dest, &dest_len, 1);

Notes: Invoking qzSetupSession with NULL for params sets up a session with default session attributed, detailed in the function description below.

If an application terminates with out invoking tear down and close functions, process termination will invoke memory and hardware instance cleanup.

If a thread terminates without invoking tear down and close functions, memory and hardware are not cleaned up until the application exits.

```
Supported Huffman Headers
```

This enumerated list identifies the Huffman header types supported by QATZip.

Enumerator

QZ_DYNAMIC_HDR Full Dynamic Huffman Trees

QZ_STATIC_HDR Static Huffman Trees

4.1.5 Function Documentation

4.1.5.1 QATZIP_API int qzClose (QzSession_T * *sess*)

```
Terminates a QATZip session
```

This function closes the connection with QAT.

This function shall not be called in an interrupt context None None Yes No Yes

Parameters

in	*sess*	Session handle (pointer to opaque instance and session data)

Return values

QZ_OK	Function executed successfully
QZ_FAIL	Function did not succeed
QZ_PARAMS	*sess is NULL or member of params is invalid

Precondition

None

Postcondition

None

Note

Only a synchronous version of this function is provided.

See Also

None

4.1.5.2 QATZIP_API int qzCompress (QzSession_T * *sess,* const unsigned char * *src,* unsigned int * *src_len,* unsigned char * *dest,* unsigned int * *dest_len,* unsigned int *last*)

```
Compress a buffer
```

This function will compress a buffer if either a hardware based session or a software based session is available. If no session has been established - as indicated by the contents of *sess - then this function will attempt to set up a session using qzInit and qzSetupSession.

The resulting compressed block of data will be composed of one or more gzip blocks per RFC 1952.

This function will place completed compression blocks in the output buffer.

The caller must check the updated src_len. This value will be the number of consumed bytes on exit. The calling API may have to process the destination buffer and call again.

The parameter dest_len will be set to the number of bytes produced in the destination buffer. This value may be zero if no data was produced which may occur if the consumed data is retained internally. A possible reason for this may be small amounts of data in the src buffer.

This function shall not be called in an interrupt context. None None Yes No Yes

Parameters

in	*sess*	Session handle (pointer to opaque instance and session data)
in	*src*	Point to source buffer
in,out	*src_len*	Length of source buffer. Modified to number of bytes consumed
in	*dest*	Point to destination buffer
in,out	*dest_len*	Length of destination buffer. Modified to length of compressed data when function returns
in	*last*	1 for 'No more data to be compressed' 0 for 'More data to be compressed'

Return values

QZ_OK	Function executed successfully
QZ_FAIL	Function did not succeed
QZ_PARAMS	∗sess is NULL or member of params is invalid

Precondition

None

Postcondition

None

Note

Only a synchronous version of this function is provided.

See Also

None

4.1.5.3 QATZIP_API int qzCompressCrc (QzSession_T ∗ *sess*, const unsigned char ∗ *src*, unsigned int ∗ *src_len*, unsigned char ∗ *dest*, unsigned int ∗ *dest_len*, unsigned int *last*, unsigned long ∗ *crc*)

```
Compress a buffer and return the CRC checksum
```

This function will compress a buffer if either a hardware based session or a software based session is available. If no session has been established - as indicated by the contents of ∗sess - then this function will attempt to set up a session using qzInit and qzSetupSession.

The resulting compressed block of data will be composed of one or more gzip blocks per RFC 1952.

This function will place completed compression blocks in the output buffer and put CRC32 checksum for compressed input data in user provided buffer ∗crc.

The caller must check the updated src_len. This value will be the number of consumed bytes on exit. The calling API may have to process the destination buffer and call again.

The parameter dest_len will be set to the number of bytes produced in the destination buffer. This value may be zero if no data was produced which may occur if the consumed data is retained internally. A possible reason for this may be small amounts of data in the src buffer.

This function shall not be called in an interrupt context. None None Yes No Yes

Parameters

in	*sess*	Session handle (pointer to opaque instance and session data)
in	*src*	Point to source buffer
in,out	*src_len*	Length of source buffer. Modified to number of bytes consumed
in	*dest*	Point to destination buffer
in,out	*dest_len*	Length of destination buffer. Modified to length of compressed data when function returns
in	*last*	1 for 'No more data to be compressed' 0 for 'More data to be compressed'
in,out	*crc*	Point to CRC32 checksum buffer

Return values

QZ_OK	Function executed successfully
QZ_FAIL	Function did not succeed
QZ_PARAMS	∗sess is NULL or member of params is invalid

Precondition

None

Postcondition

None

Note

Only a synchronous version of this function is provided.

None

4.1.5.4 QATZIP_API int qzCompressStream (QzSession_T ∗ *sess*, QzStream_T ∗ *strm*, unsigned int *last*)

```
Compress data in stream and return checksum
```

This function will compress data in stream buffer if either a hardware based session or a software based session is available. If no session has been established - as indicated by the contents of ∗sess - then this function will attempt to set up a session using qzInit and qzSetupSession. The function will start to compress the data when receiving sufficient number of bytes - as defined by hw_buff_sz in QzSessionParams_T - or reaching the end of input data - as indicated by last parameter.

The resulting compressed block of data will be composed of one or more gzip blocks per RFC 1952 or deflate blocks per RFC 1951.

This function will place completed compression blocks in the ∗out of QzStream_T structure and put checksum for compressed input data in crc32 of QzStream_T structure.

The caller must check the updated in_sz of QzStream_T. This value will be the number of consumed bytes on exit. The calling API may have to process the destination buffer and call again.

The parameter out_sz in QzStream_T will be set to the number of bytes produced in the destination buffer. This value may be zero if no data was produced which may occur if the consumed data is retained internally. A possible reason for this may be small amounts of data in the src buffer.

The caller must check the updated pending_in of QzStream_T. This value will be the number of unprocessed bytes held in QATZip. The calling API may have to feed more input data or indicate reaching the end of input and call again.

The caller must check the updated pending_out of QzStream_T. This value will be the number of processed bytes held in QATZip. The calling API may have to process the destination buffer and call again.

This function shall not be called in an interrupt context. None None Yes No Yes

Parameters

in	*sess*	Session handle (pointer to opaque instance and session data)
in,out	*strm*	Stream handle
in	*last*	1 for 'No more data to be compressed' 0 for 'More data to be compressed'

Return values

QZ_OK	Function executed successfully
QZ_FAIL	Function did not succeed
QZ_PARAMS	∗sess is NULL or member of params is invalid

Precondition

4.1.5.5 QATZIP_API int qzDecompress (QzSession_T ∗ *sess,* const unsigned char ∗ *src,* unsigned int ∗ *src_len,* unsigned char ∗ *dest,* unsigned int ∗ *dest_len*)

```
Decompress a buffer
```

This function will decompress a buffer if either a hardware based session or a software based session is available. If no session has been established - as indicated by the contents of ∗sess - then this function will attempt to set up a session using qzInit and qzSetupSession.

The input compressed block of data will be composed of one or more gzip blocks per RFC 1952.

This function shall not be called in an interrupt context. None None Yes No Yes

Parameters

in	*sess*	Session handle (pointer to opaque instance and session data)
in	*src*	Point to source buffer
in	*src_len*	Length of source buffer. Modified to length of processed compressed data when function returns
in	*dest*	Point to destination buffer
in,out	*dest_len*	Length of destination buffer. Modified to length of decompressed data when function returns

Return values

QZ_OK	Function executed successfully

QZ_FAIL	Function did not succeed
QZ_PARAMS	∗sess is NULL or member of params is invalid

Precondition

None

Postcondition

None

Note

Only a synchronous version of this function is provided.

4.1.5.6 QATZIP_API int qzDecompressStream (QzSession_T ∗ *sess*, QzStream_T ∗ *strm*, unsigned int *last*)

```
Decompress data in stream and return checksum
```

This function will decompress data in stream buffer if either a hardware based session or a software based session is available. If no session has been established - as indicated by the contents of ∗sess - then this function will attempt to set up a session using qzInit and qzSetupSession. The function will start to decompress the data when receiving sufficient number of bytes - as defined by hw_buff_sz in QzSessionParams_T - or reaching the end of input data - as indicated by last parameter.

The input compressed block of data will be composed of one or more gzip blocks per RFC 1952 or deflate blocks per RFC 1951.

This function will place completed decompression blocks in the ∗out of QzStream_T structure and put checksum for decompressed data in crc32 of QzStream_T structure.

The caller must check the updated in_sz of QzStream_T. This value will be the number of consumed bytes on exit. The calling API may have to process the destination buffer and call again.

The parameter out_sz in QzStream_T will be set to the number of bytes produced in the destination buffer. This value may be zero if no data was produced which may occur if the consumed data is retained internally. A possible reason for this may be small amounts of data in the src buffer.

The caller must check the updated pending_in of QzStream_T. This value will be the number of unprocessed bytes held in QATZip. The calling API may have to feed more input data or indicate reaching the end of input and call again.

The caller must check the updated pending_out of QzStream_T. This value will be the number of processed bytes held in QATZip. The calling API may have to process the destination buffer and call again.

This function shall not be called in an interrupt context. None None Yes No Yes

Parameters

in	*sess*	Session handle (pointer to opaque instance and session data)
in,out	*strm*	Stream handle
in	*last*	1 for 'No more data to be compressed' 0 for 'More data to be compressed'

Return values

QZ_OK	Function executed successfully
QZ_FAIL	Function did not succeed
QZ_PARAMS	∗sess is NULL or member of params is invalid
QZ_NEED_MORE	∗last is set but end of block is absent

4.1.5.7 QATZIP_API int qzEndStream (QzSession_T ∗ *sess*, QzStream_T ∗ *strm*)

```
Terminates a QATZip stream
```

This function disconnect stream handle from session handle then reset stream flag and release stream memory.

This function shall not be called in an interrupt context. None None Yes No Yes

Parameters

in	*sess*	Session handle (pointer to opaque instance and session data)

Return values

QZ_OK	Function executed successfully
QZ_FAIL	Function did not succeed
QZ_PARAMS	∗sess is NULL or member of params is invalid

4.1.5.10 QATZIP_API int qzGetStatus (QzSession_T * *sess*, QzStatus_T * *status*)

```
Get current QAT status
```

This function retrieves the status of QAT in the platform. The status structure will be filled in as follows: qat_hw-_count Number of discovered QAT devices on PCU bus qat_service_stated 1 if qzInit has been successfully run, 0 otherwise qat_mem_drvr 1 if the QAT memory driver is installed, 0 otherwise qat_instance_attach 1 if session has attached to a hardware instance, 0 otherwise memory_alloced Amount of memory, in kilobytes, from kernel or huge pages allocated by this process/thread. using_huge_pages 1 if memory is being allocated from huge pages, 0 if memory is being allocated from standard kernel memory hw_session_stat Hw session status: one of: QZ_OK QZ_FAIL QZ_NO_HW QZ_NO_MDRV QZ_NO_INST_ATTACH QZ_LOW_MEM QZ_NOSW_NO_HW QZ_NOS-W_MDRV QZ_NOSW_NO_INST_ATTACH QZ_NOSW_LOW_MEM

This function shall not be called in an interrupt context. None None Yes No Yes

Parameters

in	*sess*	Session handle (pointer to opaque instance and session data)
in	*status*	Pointer to QATZIP status structure

Return values

QZ_OK	Function executed successfully. The hardware based compression session has been created
QZ_PARAMS	*status is NULL

4.1.5.11 QATZIP_API int qzInit (QzSession_T * *sess*, unsigned char *sw_backup*)

```
Initialize QAT hardware
```

This function initializes the QAT hardware. This function is optional in the function calling sequence. If desired, this call can be made to avoid latency impact during the first call to qzDecompress or qzCompress, or to set the sw_backup parameter explicitly. The input parameter sw_backup specifies the behavior of the function and that of the functions called with the same session in the event there are insufficient resources to establish a QAT based compression or decompression session.

The required resources include access to the QAT hardware, contiguous pinned memory for mapping the hardware rings, and contiguous pinned memory for buffers.

This function shall not be called in an interrupt context. None This function will: 1) start the user space driver if necessary 2) allocate all hardware instances available Yes No Yes

Parameters

in	*sess*	Session handle (pointer to opaque instance and session data.)
in	*sw_backup*	0 for no sw backup, 1 for sw backup

Return values

QZ_OK	Function executed successfully. A hardware or software instance has been allocated to the calling process/thread
QZ_DUPLICATE	This process/thread already has a hardware instance
QZ_PARAMS	∗sess is NULL
QZ_NOSW_NO_HW	No hardware and no software session being established
QZ_NOSW_NO_MDRV	No memory driver. No software session established
QZ_NOSW_NO_INST_ATTACH	No instance available No software session established
QZ_NOSW_LOW_MEM	Not enough pinned memory available No software session established

Precondition

None

Postcondition

None

Note

4.1.5.12 QATZIP_API void∗ qzMalloc (size_t *sz,* int *numa,* int *force_pinned*)

```
Allocate different types of memory
```

Allocate different types of memory.

This function shall not be called in an interrupt context. None None Yes No Yes

Parameters

in	*sz*	Memory size to be allocated
in	*numa*	NUMA node from which to allocate memory
in	*force_pinned*	PINNED_MEM allocate contiguous memory COMMON_MEM allocate non-contiguous memory

Return values

NULL	Fail to allocate memory
address	The address of allocated memory

Precondition

None

Postcondition

None

Note

Only a synchronous version of this function is provided.

4.1.5.15 QATZIP_API int qzSetupSession (QzSession_T * *sess*, QzSessionParams_T * *params*)

```
Initialize a QATZip session
```

This function establishes a QAT session. This involves associating a hardware instance to the session, allocating buffers. If all of these activities can not be completed successfully, then this function will set up a software based session of param->sw_backup that is set to 1.

Before this function is called, the hardware must have been successfully started via qzInit.

If *sess includes an existing hardware or software session, then this session will be torn down before a new one is attempted.

This function shall not be called in an interrupt context. None None Yes No Yes

Parameters

in	*sess*	Session handle (pointer to opaque instance and session data)
in	*params*	Parameters for session

Return values

QZ_OK	Function executed successfully. A hardware or software based compression session has been created
QZ_PARAMS	*sess is NULL or member of params is invalid
QZ_NOSW_NO_HW	No hardware and no sw session being established
QZ_NOSW_NO_MDRV	No memory driver. No software session established
QZ_NOSW_NO_INST_ATTACH	No instance available No software session established

QZ_NO_LOW_MEM	Not enough pinned memory available No software session established

Precondition

None

Postcondition

None

Note

Only a synchronous version of this function is provided.

4.1.5.16 QATZIP_API int qzTeardownSession (QzSession_T * *sess*)

```
Deinitialize a QATZip session
```

This function disconnects a session from a hardware instance and deallocates buffers. If no session has been initialized, then no action will take place.

This function shall not be called in an interrupt context. None None Yes No Yes

Parameters

in	*sess*	Session handle (pointer to opaque instance and session data)

Return values

QZ_OK	Function executed successfully
QZ_FAIL	Function did not succeed
QZ_PARAMS	*sess is NULL or member of params is invalid

Precondition

None

Postcondition

Class Documentation

5.1 QzSession_S Struct Reference

`#include <qatzip.h>`

Public Attributes

- signed long int hw_session_stat
- int thd_sess_stat
- void * internal
- unsigned long total_in
- unsigned long total_out

5.1.1 Detailed Description

`QATZIP Session opaque data storage`

This structure contains a pointer to a structure with session state.

5.1.2 Member Data Documentation

5.1.2.1 signed long int QzSession_S::hw_session_stat

Filled in during initialization, session startup and decompression

5.1.2.2 void* QzSession_S::internal

Session data is opaque to outside world

5.1.2.3 int QzSession_S::thd_sess_stat

Note process compression and decompression thread state

5.1.2.4 unsigned long QzSession_S::total_in

Total processed input data length in this session

5.1.2.5 unsigned long QzSession_S::total_out

Total output data length in this session

The documentation for this struct was generated from the following file:

- include/qatzip.h

5.2 QzSessionParams_S Struct Reference

`#include <qatzip.h>`

Public Attributes

- QzHuffmanHdr_T huffman_hdr
- QzDirection_T direction
- QzDataFormat_T data_fmt
- unsigned int comp_lvl
- unsigned char comp_algorithm
- unsigned int max_forks
- unsigned char sw_backup
- unsigned int hw_buff_sz
- unsigned int strm_buff_sz
- unsigned int input_sz_thrshold
- unsigned int req_cnt_thrshold
- unsigned int wait_cnt_thrshold

5.2.1 Detailed Description

`QATZIP Session Initialization parameters`

This structure contains data for initializing a session.

5.2.2 Member Data Documentation

5.2.2.1 unsigned char QzSessionParams_S::comp_algorithm

Compress/decompression algorithms

5.2.2.2 unsigned int QzSessionParams_S::comp_lvl

Compression level 1 to 9

5.2.2.3 QzDataFormat_T QzSessionParams_S::data_fmt

Deflate, deflate with GZip or deflate with GZip ext

5.2.2.4 QzDirection_T QzSessionParams_S::direction

Compress or decompress

5.2.2.5 QzHuffmanHdr_T QzSessionParams_S::huffman_hdr

Dynamic or Static Huffman headers

5.2.2.6 unsigned int QzSessionParams_S::hw_buff_sz

Default buffer size, must be a power of 2k 4K,8K,16K,32K,64K,128K

5.2.2.7 unsigned int QzSessionParams_S::input_sz_thrshold

Default threshold of compression service's input size for sw failover, if the size of input request less than the threshold, QATZip will route the request to software

5.2.2.8 unsigned int QzSessionParams_S::max_forks

Maximum forks permitted in the current thread 0 means no forking permitted

5.2.2.9 unsigned int QzSessionParams_S::req_cnt_thrshold

Set between 1 and 4, default 4

5.2.2.10 unsigned int QzSessionParams_S::strm_buff_sz

Stream buffer size between [1K .. 2M - 5K] Default strm_buf_sz equals to hw_buff_sz

5.2.2.11 unsigned char QzSessionParams_S::sw_backup

0 means no sw backup, 1 means sw backup

5.2.2.12 unsigned int QzSessionParams_S::wait_cnt_thrshold

When previous try failed, wait for specific number of call before retry to open device. Default threshold is 8

The documentation for this struct was generated from the following file:

- include/qatzip.h

5.3 QzStatus_S Struct Reference

`#include <qatzip.h>`

Public Attributes

- unsigned short int qat_hw_count
- unsigned char qat_service_stated
- unsigned char qat_mem_drvr
- unsigned char qat_instance_attach
- unsigned long int memory_alloced
- unsigned char using_huge_pages
- signed long int hw_session_status

- unsigned char algo_sw [QZ_MAX_ALGORITHMS]
- unsigned char algo_hw [QZ_MAX_ALGORITHMS]

5.3.1 Detailed Description

```
QATZIP status structure
```

This structure contains data relating to the status of QAT on the platform.

5.3.2 Member Data Documentation

5.3.2.1 unsigned char QzStatus_S::algo_hw[QZ_MAX_ALGORITHMS]

Count of hardware devices supporting algorithms

5.3.2.2 unsigned char QzStatus_S::algo_sw[QZ_MAX_ALGORITHMS]

Support software algorithms

5.3.2.3 signed long int QzStatus_S::hw_session_status

One of QATZIP session status

5.3.2.4 unsigned long int QzStatus_S::memory_alloced

Amount of memory allocated by this thread/process

5.3.2.5 unsigned short int QzStatus_S::qat_hw_count

From PCI scan

5.3.2.6 unsigned char QzStatus_S::qat_instance_attach

Is this thread/g_process properly attached to an Instance?

5.3.2.7 unsigned char QzStatus_S::qat_mem_drvr

1 if /dev/qat_mem exists 2 if /dev/qat_mem has been opened 0 otherwise

5.3.2.8 unsigned char QzStatus_S::qat_service_stated

Check if the QAT service is running properly on at least one device

5.3.2.9 unsigned char QzStatus_S::using_huge_pages

Are memory slabs coming from huge pages?

The documentation for this struct was generated from the following file:

- include/qatzip.h

5.4 QzStream_S Struct Reference

`#include <qatzip.h>`

Public Attributes

- unsigned int in_sz
- unsigned int out_sz
- unsigned char * in
- unsigned char * out
- unsigned int pending_in
- unsigned int pending_out
- QzCrcType_T crc_type
- unsigned int crc_32
- unsigned long long reserved
- void * opaque

5.4.1 Detailed Description

```
QATZIP Stream data storage
```

This structure contains metadata needed for stream operation.

5.4.2 Member Data Documentation

5.4.2.1 unsigned int QzStream_S::crc_32

Checksum value

5.4.2.2 QzCrcType_T QzStream_S::crc_type

Checksum type in Adler, CRC32 or none

5.4.2.3 unsigned char* QzStream_S::in

Input data pointer set by application

5.4.2.4 unsigned int QzStream_S::in_sz

Set by application, reset by QATZip to indicate consumed data

5.4.2.5 void* QzStream_S::opaque

Internal storage managed by QATZip

5.4.2.6 unsigned char* QzStream_S::out

Output data pointer set by application

5.4.2.7 unsigned int QzStream_S::out_sz

Set by application, reset by QATZip to indicate processed data

5.4.2.8 unsigned int QzStream_S::pending_in

Unprocessed bytes held in QATZip

5.4.2.9 unsigned int QzStream_S::pending_out

Processed bytes held in QATZip

5.4.2.10 unsigned long long QzStream_S::reserved

CRC64 polynomial
